BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

Image Problem Mailbox.**

WHAT IS CLAIMED IS:

1. A planar light source device, comprising:
a plurality of light sources emitting different
5 colors of light; and

a light guide plate receiving light from the
plurality of light sources at a side face to
distribute the light over a surface thereof;

wherein a light emission angle differs among the
10 plurality of light sources.

2. A planar light source device according to
Claim 1, comprising a refractor mounted on an
emission surface of each of the plurality of light
15 sources for changing a direction of light, the
refractor having a different shape for the different
light sources.

3. A planar light source device according to
20 Claim 1, wherein a light emission angle of a light
source of the plurality of light sources emitting
longer wavelength light is smaller than a light
emission angle of a light source of the plurality of
light sources emitting shorter wavelength light.

25 4. A planar light source according to Claim 1,

wherein the plurality of light sources are red, green, and blue light emitting diodes.

5 5. A liquid crystal display device, comprising:

 a planar light source device according to Claim 1; and

10 a liquid crystal panel placed above an emission surface of the planar light source, the liquid crystal panel having two substrates with a liquid crystal layer interposed therebetween.

15 6. A liquid crystal display device according to Claim 5, wherein the different light sources have different light emission angles in order that wavelength dependence of transmittance at a viewing direction in the liquid crystal panel is canceled out by wavelength dependence of luminance at the viewing direction in the planar light source device.

20 7. A planar light source device, comprising:
 a plurality of light sources emitting different colors of light;

25 a light guide plate receiving light from the plurality of light sources at side face to distribute the light over a surface thereof; and

a refractor refracting light from the plurality of light sources with different refraction angles for different colors.

5 8. A planar light source device according to Claim 7, wherein the refractor is formed on a side face of the light guide plate facing the plurality of light sources, the refractor having a different shape for the different light sources.

10

 9. A planar light source device according to Claim 7, further comprising a prism plate mounted between the plurality of light sources and the light guide plate, wherein the refractor is formed on a side
15 face of the prism plate facing the plurality of light sources, the refractor having a different shape for the different light sources.

 10. A planar light source device according to
20 Claim 7, wherein a refraction angle of longer wavelength light is smaller than a refraction angle of shorter wavelength light.

 11. A planar light source according to Claim
25 7, wherein the plurality of light sources are red, green, and blue light emitting diodes.

12. A liquid crystal display device,
comprising:

5 a planar light source device according to Claim
7; and

a liquid crystal panel placed above an emission
surface of the planar light source, the liquid
crystal panel having two substrates with a liquid
crystal layer interposed therebetween.

10 13. A liquid crystal display device according
to Claim 12, wherein the different light sources have
different light emission angles in order that
wavelength dependence of transmittance at a viewing
15 direction in the liquid crystal panel is canceled out
by wavelength dependence of luminance at the viewing
direction in the planar light source device.

14. A planar light source device, comprising:

20 a light source;

a light guide plate receiving light from the
plurality of light sources at a side face to
distribute the light over a surface thereof; and

25 a hologram diffracting different light at
different angles.

15. A planar light source device according to Claim 14, wherein the hologram is placed between the light source and the light guide plate.

5 16. A planar light source device according to Claim 14, wherein the hologram is placed above an emission surface of the light guide plate.

10 17. A planar light source device according to Claim 14, wherein the hologram diffracts longer wavelength light at an angle while diffracts shorter wavelength light at a larger angle than the angle of the longer wavelength light.

15 18. A liquid crystal display device, comprising:

 a planar light source device according to Claim 14; and

20 a liquid crystal panel placed above an emission surface of the planar light source, the liquid crystal panel having two substrates with a liquid crystal layer interposed therebetween.

25 19. A liquid crystal display device according to Claim 18, wherein the hologram is arranged in order that wavelength dependence of transmittance at a

viewing direction in the liquid crystal panel is canceled out by wavelength dependence of luminance at the viewing direction in the planar light source device.
